FOREWORD

25X1D

Extensive aerial reconnaissance over about three-quarters of the industry of mainland China has resulted in the amassing of a large body of new data. This publication represents an exploratory effort to assess the feasibility of using such aerial photography to establish the aggregative level of activity at construction projects and at all types of industry throughout the mainland. For the pilot study, Wu-han, a major industrial city of Central China, was chosen because it appeared to represent a typical case.

^{*} The estimates and conclusions in this publication represent the best judgment of this Office as of 1 April 1963. ** Yuan values in this publication are given in current yuan and may be converted to US dollars at a rate of exchange of 2.46 yuan to US \$1. This rate, however, does not necessarily reflect the value of the yuan in terms of the dollar.

S-E-C-R-E-T

I. Introduction

Knowledge of Communist China's strengths and vulnerabilities continues to be a priority target. Since the demise of the "leap forward" in 1960, however, the assessment of China's productive capabilities has become increasingly difficult. Publication of meaningful information on output and the pace of construction virtually ceased after 1959. Projections based on 1959 and earlier data are tenuous in the extreme, largely as a result of the chaotic situation in Chinese industry. Indications are that the data problem will continue, perhaps for some years. For these reasons and because a significant quantity of new, high-quality aerial photography covering about three-quarters of Chinese industry became available in it was felt that a trial approach to new estimates of the level of activity in industry and construction was warranted.

25X1D

25X1D

25X1D

Although a considerable amount of photography had been taken in before the slump in the economy, the coverage and quality were inferior to that taken in However, the existence of "before" and "after" photography did offer, in theory at least, the possibility of establishing some measure of the decline in activity. By utilizing the photography in conjunction with all other sources, but particularly with recent reports of refugees, it was hoped that a reasonably objective analysis might be made.

25X1D

It was decided that an exploratory project on a single important industrial center for which photography existed should be made. Wu-han in Central China was selected. Ideally the project on Wu-han would prove the feasibility of and provide a methodology for an effort expanded to embrace the balance of Chinese industry. The levels of confidence that could be placed on further research of this nature were to be determined.

Four photographic reconnaissance missions have been flown over

25X1D 25X1D 25X1D

Wu-han. These were flown on Because of extended cloud cover over Wu-han, the flight of was not used. Careful examination was made of the remaining photography, and approximately 100 potential indicators of construction and industrial activity, including railroad yards, were initially catalogued. Research was undertaken in an attempt to identify each of these facilities and to correlate ground data with aerial observations. As a result of this exercise, 47 of the more significant facilities were tabulated and subjected to a plant-by-plant evaluation in an effort to estimate the scale of construction and industrial activity in Wu-han.

S-E-C-R-E-T

II. City of Wu-han

A. General

The complex urban area of Wu-han, with a population probably in excess of 2 million people, is the administrative center of Hupei Province. The Yangtze and Han Rivers divide metropolitan Wu-han into three parts -- the tricities of Hankow, Han-yang, and Wu-ch'ang. Wu-han is a key rail junction on the Peiping-Canton railroad as well as a major port. The Yangtze River rail and road bridge opened in 1957 is the only crossing of the Yangtze between Chungking and the sea.

Although some industry had been located in Wu-han for years before the Communist takeover in 1949, it had been of importance only locally and in Hupei Province. During the First and Second Five Year Plans the Chinese initiated plans to make Wu-han the principal industrial center of Central China and one of the five or six most important industrial cities on the mainland.

In planning projects for Wu-han the designers envisaged a vertically integrated industrial complex of sufficient capacity to supply a significant share of the machinery and equipment requirements of much of Central and South China. Plans centered on the erection of a 3-million-metric-ton iron and steel center supplied by local iron ore and limestone. Gas from the steel plant would be used as a feed material for one of the largest fertilizer plants planned in China as well as for fuel in new refractory, cement, and other facilities. Rolled steel products would be shipped less than 10 miles to what was planned to be the largest heavy machine tool plant in China, to the second largest Chinese automobile factory, to one of the two most important naval shippards in China, and to many other important machine building and light industrial projects.

The majority of the new industrial plants are on the Wu-ch'ang side of the Yangtze, and it is here that the major effort of creating a new industrial complex is being effected.* Wu-ch'ang also is the provincial administrative center and contains Wu-han University and many new scientific and industrial institutes. In Hankow, the largest of the tricities, are located a new light industrial area, many older plants of only moderate importance, POL storage, and a whole host of amalgamated cooperatives. Hankow is the principal commercial center and contains a number of military headquarters. Han-yang is a center for production of construction materials and has an important new industrial port area.

^{*} Some new plants are located in the suburbs beyond Hankow, Han-yang, and Wu-ch'ang proper but for purposes of this publication are assigned to the nearest major subdivision of Wu-han.

B. Construction Activity 25X1D
numerous sites in Wu-han were actively under construction. In contrast, photography taken in vealed construction activity to be virtually nonexistent. Photography thus positively indicates that the pace of construction slowed markedly between and, by interpretation of the evidence, it is probable that most construction activity ceased between
By a number of installations, some of which were Soviet aid projects, had been recently finished or were nearing completion in Wu-han. Among these were the Heavy Machine Tool Plant, the Wu-han Boiler Plant, the Railroad Car Manufacturing Plant, the Ching Shan Cement Plant, and a meat-processing factory. At the Wu-han Iron and Steel Plant, some units, such as two coke batteries and the first blast furnace, already had been completed. In addition, ground had been broken and foundations laid for many more plants that together with those completed would form the base of the new industrial complex in the Wu-ch'ang part of Wu-han. These included among others the Forging Equipment Plant, the Electrical Equipment Plant, the Bearing Plant, a new textile mill, and the Automobile Plant.*
From analysis of the comparative photography, it is clear that a considerable volume of construction was completed after but this volume is far less than would be expected if the level of activity had continued through until On the assumption that, in general, the level of construction in continued up until the time of the near cessation of construction, it is estimated that work proceeded for a period of from 9 months to 1 year. Thus it is believed that, except for a few projects, construction activity in Wu-han dropped very sharply between Some activity probably continued at the Wu-han Iron and Steel Plant and the Machine Building Plant (Installation 15, Appendix A). The city-wide drop in construction activity apparently preceded the departure of Soviet technicians from China later in the summer of It was not possible to ascertain whether such slackened activity occurred at Soviet aid projects in Wu-han as early as the period
As might be expected, evidence suggests that priorities were assigned to various construction projects. The Forging Equipment Plant and Factory B (Installation 4, Appendix A) apparently were at the same stage of construction in
* For the status of these and other projects in as well as see Appendix A.

S-E-C-R-E-T

much larger Forging Equipment Plant had progressed considerably further. Both of these facilities had a higher priority than the Wu-ch'ang Railroad Station, Factory A (Installation 3, function unknown), and the important Industrial Railroad Spur (Installation 16), where no progress was noted between 1959 and 1962. Although no clear pattern of priorities was readily recognizable from the sample given in Appendix A, it appears that factories with medium to heavy machine building characteristics were favored.

25X1D

The only construction progress noted at all in the period was at the Forging Equipment Plant. As noted above, this period of relative inactivity is believed to have extended back 25X1D through

25X1D

25X1D

25X1D

25X1D

Examination of construction materials enterprises in Wu-han confirms the low level of activity in the construction effort in Of 15 brick plants observed, only 2 appeared to be operative, the precast concrete plant looked inactive, and the new cement plant in Wu-ch'ang was not in operation. The Railroad Tie Treating Plant in Han-yang, a Soviet aid project and the largest tie-treating facility in China, afforded the best "before" and "after" comparison of any installation in Wu-han. ties awaiting processing was visible, with relatively few treated This situation contrasts sharply with the phototies in e<u>viden</u>ce. in which there are no untreated ties graphy of but extensive stores of treated ties, pointing to a high level of and an extremely low railroad maintenance and construction in

25X1D

C. Industrial Activity

level in

25X1D 25X1D

25X1D

The level of industrial activity in the city of Wu-han in was much lower than in Generally, installed capacity was being utilized at a rate no higher than and probably below onea volume of capital investthird of the available capacity. ment exceeding 1 billion yuan was tied up in idle capacity and construction projects in the Wu-han area. This situation apparently has existed for about 2 years.

25X1D

Two major problems confronted the attempt to assess the level of industrial activity in Wu-han. In varying degrees these same obstacles would be encountered in studies of other Chinese industrial centers for which photography is available. First and foremost was the problem of estimating activity at machine building plants from

see * For the level of industrial activity in Appendix B.

S-E-C-R-E-T

aerial photography in the absence of ground data. The second problem was one of correlating aerial observations with ground information received from refugees and Chinese Communist news media.

The problem of estimating the level of production from aerial observations of machine building plants was considerably more difficult than in the processing industries, where visible stocks of raw materials and other outdoor operations sometimes provided clues to the degree of activity. Industry in Wu-han is, with some exceptions, primarily of a machine building character. In the absence of any information other

25X1B

25X1B

Given

a "one-time" observation, none of these indicators is very reliable.*

When information other than aerial photography was available, even though generally quite poor, it was helpful. However, the attempt to correlate the two often culminated in the following impasse. Where the aerial photography clearly revealed the presence and location of an installation, the ground data were too meager or not recent enough to identify the facility or name its products. Conversely, where Chinese news media spoke of a certain plant producing a particular product, it was not possible to locate the factory and determine whether it was one of the installations unidentified in the aerial photography.

The inability to correlate all available air and ground information resulted in a list of plants visible from the air and, therefore, located, but with function unknown, and another list of producing plants whose product was known but whose location was not. All plants or installations in Wu-han viewed from the air and judged to be important, whether the name or function of the facility was known or not, are shown in Appendix B. The residue, or list of producing plants generated from ground data that could not be correlated with installations in Appendix B, is as follows: Asbestos Plant, Cast Iron Pipe Plant, Crane Plant, Electric Battery Works, Electrolytic Aluminum Plant, Glass Works, Insecticide Plant, Powder Metallurgy Works, and Synthetic Ammonia Plant. Although larger than cooperatives, which have been excluded as far as is known, none of these plants is believed to be a major production facility.

The degree of production activity in Wu-han in difficult to assess from aerial photography, except in a few instances, because of the poorer quality of the film and some cloud cover over the city. The photography does show considerable activity at the Railroad Tie Treating Plant, the Military Motor Vehicle Repair Facility,

25X1D

^{*} For a discussion of problems of indicators and the degree of confidence that can be placed on them, see Appendix C.

25X1D

three Han-yang Brick Plants, and the Chiang-an Railroad Repair Shops. Ground information in 1959 was relatively good compared with that in 1962 and indicated a very high level of production activity generally. Construction activity and operations in the construction materials industry also were at high levels in

25X1D

In ascertaining the level of industrial production in Wu-han in a detailed examination was made of each installation of significance. A summary of the determination made for each plant is set forth in Appendix B. Only rarely was it possible to state with any assurance that a facility had a certain capacity and that such capacity was being used at a particular rate. In many cases, however, it was possible to state that a certain plant was or was not operative, was only slightly active, or was very active. As the sample of installations grew, the reliability of the over-all evaluation of the level of industrial activity rose commensurately.

25X1D

A look at Appendix B clearly suggests a relatively low rate of production in While signs of some activity were seen at the Wu-han Iron and Steel Plant, the Heavy Machine Tool Plant, the Ching Shan Power Station, the Wu-chang Shipyard, the Railroad Car Manufacturing Plant, and Chiang-an Railroad Repair Shops, no evidence of production was noted at the Ching Shan Cement Plant, the Wu-han Boiler Plant, the Electrical Equipment Plant, the Bearing Plant, the Automobile Plant, the Steel Fabricating Shop, the Railroad Tie Treating Plant, the Tun-kou Paper Mill, and the Thermal Electric Powerplant at Hankow. Because most estimates of the level of activity at each plant were qualitative, however, it was not possible to evolve a methodology yielding a definite answer in terms of percentage of capacity operated. Moreover, ground information revealed that some factories, in an effort to maintain their staffs, were producing items other than those originally intended. The problem was further compounded by having a number of projects in the construction stage and capable of only partial production. Instead of a quantitative estimate, an intuitive appraisal was made, which placed the level of industrial activity at a rate no higher than and probably somewhat below one-third of the industrial capacity installed in Wu-han in 1962.

25X1B

marked contrast to that in China. In Wu-han, in one count of 84 smokestacks only 4 were found emitting smoke (for the reliability of smoke as an indicator, see Appendix C) and this was in when many plants generating steam for heat alone should still have been active.

A further indication of the level of activity in the Wu-han area was given by the status of the two principal electric power stations there (Installations 12 and 31 in Appendix B). In the 32-megawatt (mw) station in Hankow was shut down, and the 162-mw unit near the steel plant was estimated to be operating at a daily, 24-hour rate equivalent to 53 percent of capacity.* On the basis of known additions to generating capacity and the data above, an estimate of power consumed by industry in was made. The analysis showed that, excluding iron and steel plant operations, industry in the Wu-han area in utilized less than 40 percent of the power consumed by industry in

25X1D

25X1D

25X1D

25X1D

An examination of the photography taken in showed little if any change in the level of activity observed in

S-E-C-R-E-T

APPENDIX B

25X1D

STATUS OF PRODUCTION AT SELECTED INDUSTRIAL PLANTS IN WU-HAN

25X1D

	25X1D		
Installation	Production	Observations	,
1. (Probable) Textile Mill, Wu-ch'ang	Probably none	Production building complete; not known whether all equipment is installed, but doubtful	
 Railroad Car Manufacturing Flant, Wu-ch'ang 	Plant is active and probably engaged in repair and maintenance work; little if any production of new equipment	Before current expansion, plant produced 700 and possibly more freight cars per year; expansion nearly complete; status of equipment in new buildings unknown	
 (Probable) Forging Equipment Flant, Wu-ch'ang 	No evidence of production	Has one stack, no smoke; absence of rail spur into plant area makes it doubtful that capacity would be in use as designed; plant has received priority in construction and is 90 percent completed	
. Heavy Machine Tool Flant, Wu-ch'ang	Some modest activity probable; at most, output would be only one-third to one-half that in	Has 8 to 10 stacks including foundry, no smoke; although plant was visited in the accounts of the scale of output are very poor other than the report that the plant is being operated well below capacity	2
. Chen-huan Cotton Textile Mill, Wu-ch'ang	Not in production	A large, sprawling, obsolete mill whose facilities are now used for training purposes	
. Powerplant, Wu-ch'ang	In operation	A small power station of less than 5-megawatt (mw) capacity; one stack with heavy smoke	
. Hu-pei No. 1 Cotton Mill, Wu-ch'ang	Probably in operation but producing very little cotton cloth	Three stacks including powerhouse, no smoke; excellent report states that in all textile plants in Wu-han were shut down owing to the lack of raw materials; probable dye works connected with plant	25
 Military Motor Vehicle Repair Facility, Wu-ch'ang 	Very active	Many trucks in the courtyards of this one-time arsenal; change in disposition of trucks between March and	2
Factory C (purpose unknown), Wu-ch'ang	Some activity possible of unknown type	One stack; no smoke, probably never has smoked; piles of material along rail spun 6 aret	

changed during

	Installation	Production	Observations	
10.	The shipper	Several barges and perhaps one ship on ways, probably undergoing repairs	Yard still under construction	
11.	Ching Shan Cement Flant, Wu-ch'ang	Not in operation	This 300,000-metric-ton plant has operated in the past	
12.	- Guatan the shipper	Estimated to be operating at a daily rate equivalent to about 53 percent of capacity	162-mw thermal electric power station; Soviet aid project which went into partial operation in	25X1D
13.	Wu-han Iron and Steel Flant, Wu-ch'ang	Some coke and pig iron being produced and possibly a little crude steel; no rolled products believed to be produced	Planned capacity, 3 million tons of crude steel; of six open hearths, never more than two have operated, and in none appeared to be operative; capacity completed thus far has never been used at a rate in excess of 30 percent	25X1D
14.	Wu-han Boiler Flant, Wu-ch'ang	Probably produces limited quantities of agricultural or chemical equipment; re- pairs boilers but probably does not produce them, although it has done so in the past	Five large stacks, no smoke; no railroad cars in plant area; started limited production in 4th quarter of was turned over to the state on	25X1D 25X1D
15.	(Probable) Electrical Equipment Flant, Wu-ch'ang	Repairs steam turbines, generators, alternating current motors, trans- formers, and other equipment; although plant has produced new equipment, it probably does not now do so	Three stacks, no smoke; continued failure to complete the rail spur precludes the use of this facility for production of heavy turbines, generators, and trans- formers as designed	05V4D
16.	(Possible) Bearing Flant, Wu-ch'ang	Some production possible	Several trucks only evidence of activity; some bearings were produced in the fall of the the capacity of the plant was stated to be 30,000 bearings a month	25X1D
17.	Factory D (purpose unknown),	No evidence of production	Two stacks, no smoke; no vehicles in area; rail spur to factory incomplete	
18.	Factory E (purpose unknown), Wu-ch'ang	Only slightest evidence of production	Three stacks, no smoke; materials storage indicates possibility of production; no vehicles	
19	Machine Building Flant (product unknown), Wu-ch'ang	Possibly some production	Two stacks, no smoke; rail spur incomplete; construction of all but one building complete	
20	. Automobile Flant, Wu-ch'ang	Not producing trucks in 25X1D	Six stacks, no smoke, although at least one stack has been used in past; design capacity of completed plant to be 50,000 vehicles; produced 25 trucks in not known to have produced since	25X1D

- 16 -S-E-C-R-E-T

S-E-C-R-E-T

	Installation	Production	Observations
1.	(Possible) Internal Combustion Engine Factory, Wu-ch'ang	Possibly some production of spare parts	Production facilities still under construction
2.	Wu-ch'ang Shipyard, Wu-ch'ang	Shipyard is active but operating well below its potential	Yard has built W-class submarines; submarine in the river in identical position in
	Storage and Warehouse Area, Wu-ch'ang	Light activity	Rail-served area has 22 warehouses, each about 45 x 180 feet; some change in outdoor storage piles noted between
4.	Railroad Tie Treating Flant, Han-yang	Not in operation	In contrast to when many untreated ties lay about awaiting treatment, no untreated material was visible in either no smoke from tie-treating plant
5.	(Probable) Steel Fabricating Shop, Han-yang	Inactive	Two stacks, no smoke; rail-served
5.	New Port Area, Han-yang	Port active	Railroad cars were seen in different positions in and the whole New Port Area was constructed and brought into operation between
•	Tun-kou Paper Mill, Han-yang	Probably inactive	One large stack, no smoke; mill was finished in and has produced newsprint and "straw" paper
١.	Brick Flants, Han-yang	Two of the 14 brick plants in Han-yang and its suburbs appear to be active	Of 14 or more stacks, 2 possibly were smoked; large storage areas of finished brick visible with no changes noted between
	Ferrous or Nonferrous Processing Plant, Han-yang	Some activity	Four large stacks, one smoking; plant still being expanded by filling in lake; the purpose of this installation not clear
٥.	Wu-han No. 1 Cotton Mill, Han-yang	Indeterminate	No photography or ground evidence to suggest the level of operation of this mill; it was producing in
1.	Thermal Electric Powerplant, Hankow	Not in operation	A 32-mw thermal electric station with two large stacks, no smoke, coal storage low; no evidence of cooling water being returned to the Han River

25X1D

25X1D 25X1D25X1D

25X1D

25X1D

Installation		Production	Observations
32.	Shen-hsien Textile Flant, Hankow	Significantly less than in	the plant was forced to give one of two large mill buildings to neighboring plant; thus production would be much less than in
33.	Automobile Parts Manufacturing Flant, Hankow	Indeterminate	Took over portion of the neighboring Shen-hsien Textile Mill in function was to be transferred to the Automobile Flant in no evidence exists as to whether transfer was made
34.	Wu-han Chemical Materials Factory, Hankov	Probably in normal production status	This factory, which primarily produces alcohol, had a line of small white trucks or wagons at its doors in both
35.	Factory F (purpose unknown), Hankow	Some activity	Two stacks, one smoking; 12 large and many smaller buildings of mixed type
36.	Light Industrial Area, Hankov	Little if any production except at pharmaceutical plant	This area contains a pharmaceutical plant, a dye works, a paint-manufacturing plant, a glass bottle producer, and several others; some units appear to be complete, others are still under construction. Area contains at least seven stacks, no smoke
37.	Chiang-an Railroad Repair Shops, Hankow	Producing freight car components, in- cluding wheels for the Wu-ch'ang Railroad Car Plant	Many railroad cars in and around shops
38.	Factory C (purpose unknown), Hankov	Not believed to be in operation	At the end of the new rail spur; the heavy type of construction indicates machine building operations
39.	Precast Concrete Plant, Hankow	Appears to be inactive
